## Warm Up

For each set of coordinate points, write the new set of coordinate points after: Moving them up 4 units, then right 6 units then down 8 units.

1) $(-2,0)$
 $(4,4)$ $(4,-4)$
2) $(0,2)$

$(6,-2)$
3) $(-4,-1)$

4) $(-3,-6)$

$(3,-2)$

$$
(3,-10)
$$

5) $(5,-3)$
$(5,1)$
$(11,1)$
$(11,-7)$
6) $(4,4)$

## ESSENTIALOUESTION

What are the properties of a translation?

Needed Vocab:

- Composition of Rigid Motions

GOAL: "I CAN. . .
Describe the properties of a
figure before and after translation."

Draw $\triangle X Y Z$ on a coordinate plane. Then copy the triangle to somewhere else on the same coordinate plane and label it $\Delta$ RST. Describe how you could move the original to map it to its new location.

$$
(x+10, y-4)
$$

## Translations

A translation is a transformation in a plane that maps all points of a preimage the same distance and in the same direction.

The translation of $\triangle A B C$ by $x$ units along the $x$-axis and by $y$ units along the $y$-axis can be written as $T_{\langle x, y\rangle}(\triangle A B C)=\triangle A^{\prime} B^{\prime} C^{\prime}$.
A translation has the following properties:
If $T_{\langle x, y\rangle}(\triangle A B C)=\triangle A^{\prime} B^{\prime} C^{\prime}$, then

- $\overline{A A^{\prime}}\left\|\overline{B B^{\prime}}\right\| \overline{C C^{\prime}}$.
- $\overline{A A^{\prime}} \cong \overline{B B^{\prime}} \cong \overline{C C^{\prime}}$.

- $\triangle A B C$ and $\triangle A^{\prime} B^{\prime} C^{\prime}$ have the same orientation.

A translation is a rigid motion, so length and angle measure are preserved.

## EXAMPLE 1 Finding the Image of a Translation.

What is the graph of $T_{\langle 7,-4\rangle}(\triangle E F G)=\triangle E^{\prime} F^{\prime} G^{\prime}$ ?

1. What are the vertices of $\Delta E^{\prime} F^{\prime} G^{\prime}$ for each translation?
(a. $T_{\langle 6,-7\rangle}(\triangle E F G)=\triangle E^{\prime} F^{\prime} G^{\prime}$
(b. $T_{\langle 11,2\rangle}(\triangle E F G)=\triangle E^{\prime} F^{\prime} G^{\prime}$

Example 2 Write a Translation Rule

What translation rule maps $S T U V$ onto $\boldsymbol{S}^{\prime} \boldsymbol{T}^{\prime} \boldsymbol{U}^{\prime} \boldsymbol{V}^{\prime}$ ?

$$
T_{\langle-1,-4\rangle}(S T \cup V)=\left(s^{\prime} T^{\prime} \cup^{\prime} v^{\prime}\right)
$$

2. What translation rule maps $P(-3,1)$ to its image $P^{\prime}(2,3)$ ?

$$
T_{\langle 5,2\rangle}{ }^{(P)=(P)}
$$

## Composition of Rigid Motions

A composition of rigid motions is a transformation with two or more rigid motions in which the second rigid motion is performed on the image of the first rigid motion.

## Step 1 Translate $\triangle A B C$ left 2 units and up 5 units.

Step 2 Reflect $\triangle A^{\prime} B^{\prime} C^{\prime}$ across line $\ell$.

This notation uses a small open circle to indicate a composition of rigid motions on $\triangle A B C$.

## Example 3 Compose Translations

In learning a new dance, Kyle moves from position $A$ to position $B$ and then to position $C$. What single transformation describes Kyle's move from position $A$ to position C?

Compose Translations

## 3. What is the composition of the transformations written as one transformation?

a. $T_{\langle 3,-2\rangle} \circ T_{\langle 1,-1\rangle} \quad T_{\langle 4,-3\rangle}$
b. $T_{\langle-4,0\rangle} \circ T_{\langle-2,5\rangle} T_{\langle-6,5\rangle}$

## EXAMPLE 4 Relate Translations and Reflections

How is a composition of reflections across parallel lines related to a translation?

Reflect $\triangle A B C$ across the $y$-axis and then reflect the image across the line $x=4$. What do you notice about the points of the preimage and the final image.
$\triangle A B C: A(-2,2), B(-2,4), C(0,2)$

4. Suppose $n$ is the line with equation $y=1$. Given $\triangle D E F$ with vertices $D(0,0), E(0,3)$, and $F(3,0)$, what translation image is equivalent to $\left(R_{n} \circ R_{x \text { axis }}\right)(\triangle D E F)$ ?

$$
T\langle 2, \varnothing\rangle(\Delta D E F)=\left(\Delta D^{\prime} E^{\prime} F^{\prime}\right)
$$

## Translations and Compositions of Rigid Motions

WORDS A translation is a transformation that maps all points the same distance and in the same direction.

## GRAPH

SYMBOLS $T_{\langle-4,-6\rangle}(\triangle A B C)=\triangle A^{\prime} B^{\prime} C^{\prime}$
$\overline{A A^{\prime}}\left\|\overline{B B^{\prime}}\right\| \overline{C C^{\prime}}$
$\overline{A A^{\prime}} \cong \overline{B B^{\prime}} \cong \overline{C C^{\prime}}$

A composition of two reflections across parallel lines is a translation.

## DIAGRAM

$$
A A^{\prime \prime}=B B^{\prime \prime}=C C^{\prime \prime}=2 d
$$
