Warm Up Write an equation of the line passing through point $P$ that is perpendicular to the given line.

1. $P(-2,4), y=-\frac{2}{3} x+\frac{5}{2}$
2. $P(5,11), y=8$
3. $P\left(\frac{3}{4},-9\right), y=x$
4. $P(1,-7), y=2 x+3$
5. $P(3,-2), 3 x-5 y=4$
6. $P\left(-\frac{1}{2},-\frac{3}{2}\right), x=-3$

## Essential Question

What are the properties of the medians in a triangle? What are the properties of the altitudes in a triangle?

Needed Vocab:

- Altitude
- Centroid
- Median
- Orthocenter

GoAl: "I CAN. .
Find the points of concurrency for the medians and the altitudes of a triangle."

With Your Table

- Draw $\triangle A B C$ with vertices at: $A(0,2), B(6,6)$ and $C(8,0)$
- Find the midpoint of all three sides. Starting with the midpoint of BC label them D, E and F. (Clockwise)
- Draw in segment $A D$. This is called a median of $\triangle A B C$.
- Draw in all of the medians of the triangle.
- Label the intersection of the medians as point G.
- What conjecture can you come up with about where the medians of the triangle intersect?
- Need another triangle to figure out the conjecture? Plot $\mathrm{R}(1,7), \mathrm{S}(7,1)$, $\mathrm{T}(1,1)$ and follow the previous steps. This should help you figure out a solid conjecture. Discuss with the table next to you to figure it out.

## Centroid Theorem

The centroid of a triangle is two-thirds of the distance from each vertex to the midpoint of the opposite side. The centroid is always inside the triangle.

Then...

$$
A G=\frac{2}{3} A D \quad B G=\frac{2}{3} B E \quad C G=\frac{2}{3} C F
$$

## EXAMPLE 1

In the diagram Q is the centroid. What is the length of $\overline{J N}$ ?

Find AD in both figures.

There are three paths through a triangular park. Each path goes from the midpoint of one edge to the opposite corner. The paths meet at point $P$.

1. Find $P S$ and $P C$ when $S C=2100$ feet.
2. Find $T C$ and $B C$ when $B T=1000$ feet.

3. Find $P A$ and $T A$ when $P T=800$ feet.

## With your Table

- Graph $\Delta A B C$ and $\Delta R S T$. $A(4,4), B(7,-2), C(-2,-2), R(7,4), S(7,-4)$, T(-1,0)
- Make a line from vertex A that intersects segment BC at a perpendicular angle. Label the intersection point $D$. This is the altitude of the triangle (Height).
- Draw the other two altitudes from $B$ and $C$ and label their intersections E and F respectively.

The point of concurrency for the altitudes of a triangle it is call the Orthocenter.

## Orthocenter

The lines that contain the altitudes of the triangle are concurrent. This point of concurrency is the orthocenter. It is located IN an acute triangle, ON a right triangle (Vertex of the right angle), and OUTSIDE an obtuse triangle (the obtuse angle points at the orthocenter).

Then... $\overline{K Q}, \overline{L N}$, and $\overline{M P}$ are concurrent at $X$

## EXAMPLE 2

Find the coordinates of the orthocenter of $\triangle X Y Z$ with vertices $X(-5,-1), Y(-2,4)$, and $Z(3,-1)$.

Tell whether the orthocenter of the triangle with the given vertices is inside, on, or outside the triangle. Then find the coordinates of the orthocenter.
6. $A(0,3), B(0,-2), C(6,-3)$
7. $J(-3,-4), K(-3,4), L(5,4)$

## How to find..

## Centroid

- Draw the triangle for which you are supposed to find the

## Orthocenter

- Draw the triangle for which you are supposed to find the
- Draw the triangle for which you are supposed to find the centroid of.
- Using the slope, find the midpoint of each side of the triangle.
- Using a straight edge, draw in the line between the opposite vertex and the midpoints.
- Draw the triangle for which you are supposed to find the orthocenter of.
- Find the slope of each side of the triangle.
- Apply the perpendicular slope from the opposite vertex in the direction the orthocenter is.
